(54) Title: FLUIDIC CONNECTION SYSTEM AND METHOD

(57) Abstract

A wound dressing (10) includes a cover membrane (22) comprising a semi-permeable material with an adhesive-coated (30) skin contact surface (28). An opening (32) is formed in an interior portion of the membrane. An intermediate layer of material may be placed between the wound and the membrane contact surface for either absorbing fluids from the wound, e.g. with a hydrocolloid or hydrophilic material, or for passing such fluids to the opening with a synthetic material, e.g. rayon. A tube (34) includes a proximate end (36) fluidically communicating with the wound through the membrane opening. A distal end (38) of the tube is adapted for connection to a suction source (47) for draining the wound or a fluid source for introducing liquid medication to the wound. Both evacuation and introduction can be either active or passive. A wound treatment method is also disclosed.

DESIGNATIONS OF "DE"

Until further notice, any designation of "DE" in any international application whose international filing date is prior to October 3, 1990, shall have effect in the territory of the Federal Republic of Germany with the exception of the territory of the former German Democratic Republic.

	. 1
1	FLUIDIC CONNECTION SYSTEM AND METHOD
2	
· 3	Cross-Reference to Related Application
4	
5	Continuation-in-Part of U. S. Patent Application Serial
6	Number 07/332,699, filed April 3, 1989.
7	
8	Background of the Invention
9	
10	1. Field of the Invention.
11	The present invention relates generally to fluidic
12	connection systems, and in particular to systems for
13	draining liquids from and introducing liquids to patients.
14	
15	2. Description of the Relevant Art.
16	Various types of fluidic connection systems have
17	heretofore been devised to meet the requirements of
18	particular applications. In the medical field, fluidic
19	connection systems find many applications, including wound
20	dressings and systems for introducing fluids to and removing
2 1 ⁻	fluids from patients.
22	Wound dressings are typically applied over various
23	types of wounds to promote healing and to reduce the risk of
2 4	infection. Although various types of dressing materials
25	have been successfully employed, membranes comprising semi-
26	permeable materials are often preferred because they can
27	increase patient comfort and lower the risk of infection.
28	Semi-permeable membranes generally pass moisture vapors, but
29	are generally impervious to liquids. Thus, they can promote
30	healing by permitting a wound site to "breathe".

- 1 However, a problem can arise with semi-permeable
- 2 membranes when they are placed over draining wounds because
- 3 they tend to retain fluid. For example, surgical wounds
- 4 often tend to drain for a post-operative period of about
- 5 forty-eight hours. The fluid that can accumulate under such
- 6 a semi-permeable membrane during a draining period can
- 7 macerate the underlying tissue, cause infection and
- 8 otherwise inhibit healing. A procedure for alleviating this
- 9 problem involves periodically piercing the membrane,
- 10 draining the accumulated fluids and resealing the membrane
- 11 opening. However, such a procedure is time-consuming for
- 12 health care professionals and, unless it is conducted at
- 13 relatively frequent intervals, can be relatively ineffective
- 14 in dealing with the problems associated with trapped fluid
- 15 accumulation. Other procedures which involve opening or
- 16 changing wound dressings tend to have problems associated
- 17 with exposing a wound to a greater risk of infection and can
- 18 be uncomfortable for patients.
- 19 Another disadvantage with many previous wound dressings
- 20 is that they are not designed to accommodate the
- 21 introduction of various liquid medications, such as
- 22 antibiotics and growth factor solutions. The application of
- 23 growth factor solutions may be particularly important in the
- 24 regeneration of skin graft donor sites.
- 25 Catheters are another type of fluidic connection system
- 26 with medical applications. They are commonly used for
- 27 withdrawing fluids from or introducing fluids to patients'
- 28 bodies. For example, urethral catheters are inserted into
- 29 the bladder through the urethra for withdrawing urine.
- 30 Typical applications for urethral catheters include patients

1 who are incontinent or have otherwise lost voluntary control 2 of their bladder functions, e.g. a paraplegic with a spasdic 3 bladder condition. However, patients fitted with urethral 4 catheters are often subjected to risks of bladder and urinary tract infections. To avoid some of these infection risks, condom 7 catheters have been devised which typically include a body for placement over the penis and a bellows-type distal end for resisting kinks and for connection to a drain tube. 10 However, condom catheters are susceptible to slippage and 11 can be difficult to maintain in place unless they are taped to the patient's penis. Furthermore, there can be 12 13 difficulties in effectively draining sudden surges of urine, 14 which often back up and cause leakage problems. 15 Heretofore there has not been available a fluidic connection system and method with the advantages and 16 17 features of the present invention. 18 19 Summary of the Invention 20 In the practice of the present invention, a fluidic 21 connection system is provided which includes a semipermeable membrane including a pair of panels each having a perimeter and an edge strip. The membrane is formed by

22 23 24 25 connecting the panel edge strips together to form a seam 26 extending transversely across the membrane. The panels and 27 the membrane include inner and outer surfaces. A tube

opening extends through the seam between the panel edge

29

28

- 1 strips and between the membrane inner and outer surfaces.
- 2 The membrane inner surface is coated with an adhesive for
- 3 attachment to the skin of a patient.
- A tube or sheath includes a proximate end extending
- 5 through the tube opening and a distal end positioned in
- 6 spaced relation from the membrane outer surface. In one
- 7 embodiment, the tube proximate end includes a side opening
- 8 which is positioned in proximity to the membrane inner
- 9 surface. In another embodiment the tube proximate end is
- 10 bifurcated by a pair of longitudinally-extending slits
- Il 'separating a pair of tabs. A passage extends through the
- 12 sheath between its ends.
- An inner conduit can be placed in the sheath passage
- 14 and can include a connection seal assembly for forming a
- 15 fluid-tight seal with the sheath. The inner, tubular
- 16 conduit can be provided with a funneled proximate end for
- 17 using the system as a condom catheter.
- When the fluidic connection system is used as a wound
- 19 dressing, an intermediate layer of material can be applied
- 20 between the wound and the cover membrane inner surface.
- 21 Furthermore, the fluidic connection system of the present
- 22 invention can be used to secure a percutaneous drainage tube
- 23 within a patient, e.g. by inserting the percutanious tube
- 24 through the sheath passage.
- In the practice of the method of the present invention,
- 26 an intermediate layer of material can be applied to a wound
- 27 site and the cover membrane can then be placed thereover.
- 28 The cover membrane can be releasably, adhesively fastened to
- 29 the skin around a periphery thereof. A tube fluidically
- 30 communicates with the wound through an opening in the

membrane. Fluids from a draining wound can be evacuated through the tube and liquid medication and irrigation can be introduced through the tube to the wound site. evacuation and introduction steps of the method can each be accomplished both actively and passively, and can be 5 alternated in a wound treatment procedure. Additional steps that can be included in the method of the present invention include extending an inner conduit through the sheath and 8 sealing the inner conduit and the sheath together in a 10 fluid-tight engagement. 11. 12 Objects and Advantages of the Preferred Embodiments 13 The principle objects and advantages of the present 14 15 invention include: to provide a wound dressing; to provide 16 such a dressing which promotes the evacuation of drainage fluids; to provide such a dressing which permits the 17 introduction of liquid medications; to provide such a 18 19 dressing which includes a semi-permeable membrane for 20 releaseable, adhesive attachment to the skin surface surrounding a wound; to provide such a dressing which 21 protects against infection; to provide such a dressing which 22 promotes healing; to provide such a dressing which is economical to manufacture, efficient in operation, capable 24 25 of a long operating life and particularly well adapted for the proposed usage thereof; to provide a wound treatment method; to provide a fluidic connection system and method; 27 to provide such a connection system and method which are

adaptable to various applications; to provide such a

connection system and method which can be utilized as a

29.

30

condom catheter; to provide such a connection system and method which are suitable for securing percutanious tubing; 2 to provide such a connection system which infrequently 3 requires changing; and to provide such a connection system 4 and method which promote patient comfort, reduce risk of 5 infection, are usable with catheters of various configurations and which are easy to apply and use. 7 Other objects and advantages of this invention will 8 become apparent from the following description taken in conjunction with the accompanying drawings wherein are set 10 forth, by way of illustration and example, certain 11 embodiments of this invention. 12 The drawings constitute a part of this specification 13 and include exemplary embodiments of the present invention 14 and illustrate various objects and features thereof. 16 Brief Description of the Drawings 17 18 Fig. 1 is a top perspective view of a wound dressing 19 embodying the present invention. 20 Fig. 2 is an enlarged, vertical, cross-sectional view 21 of the dressing taken generally along line 2-2 in Fig. 1. 22 Fig. 3 is a top plan view of the dressing. 23 Fig. 4 is an enlarged, fragmentary, bottom perspective 24 view of the dressing, particularly showing a proximate end 25 of the tube. 26 Fig. 5 is an enlarged, fragmentary, top perspective 27 view of the dressing, particularly showing a tube closure clip. 29

5	Detailed Description of the Preferred Embodiments
6	
7	I. Introduction and Environment
8	
9	As required, detailed embodiments of the present
10	invention are disclosed herein; however, it is to be
11	understood that the disclosed embodiments are merely
12	exemplary of the invention, which may be embodied in various
13	forms. Therefore, specific structural and functional
14	details disclosed herein are not to be interpreted as
15	limiting, but merely as a basis for the claims and as a
16	representative basis for teaching one skilled in the art to
17	variously employ the present invention in virtually any
18	appropriately detailed structure.
19	Certain terminology will be used in the following
20	description for convenience and reference only and will not
21	be limiting. For example, the words "upwardly",
22	"downwardly", "rightwardly" and "leftwardly" will refer to
23	directions in the drawings to which reference is made. The
24	words "inwardly" and "outwardly" will refer to directions
25	toward and away from, respectively, the geometric center of
26	the structure being referred to. Said terminology will
27	include the words specifically mentioned, derivatives
28	thereof and words of similar import.
29	

1	Referring	to	the	drawings	in	more	detail,	the	reference
	and the second								

- 2 numeral 10 generally designates a wound dressing embodying
- 3 the present invention. The dressing 10 is adapted for
- 4 protecting and treating a variety of wounds, such as that
- 5 shown at 12. Without limitation on the generality of the
- 6 useful applications of the present invention, the dressing
- 7 10 may be applied over burns, cuts, scrapes and ulcers of
- 8 various types, e.g. diabetic, decubitus, peripheral
- 9 vascular disease, venous stasis and trauma ulcers.
- Skin ulcers are a common problem among many diabetics,
- 11 and are often brought on by poor blood circulation and nerve
- 12 damage associated with diabetes. The treatment of such
- 13 ulcers often involves grafting skin from a relatively
- 14 healthy donor site to an ulcerous wound site. Split
- 15 thickness surgical skin graft techniques may be employed to
- 16 obtain skin grafts from donor sites that can then heal
- 17 spontaneously. Full thickness skin grafts, on the other
- 18 hand, generally require closure of the donor site. It will
- 19 be appreciated from the following description that the wound
- 20 dressing and treatment method of the present invention is
- 21 particularly well adapted for the protection and
- 22 regeneration of skin graft donor sites by providing a single
- 23 dressing which facilitates both fluid drainage and growth
- 24 factor introduction.
- The wound site 12 is surrounded by healthy skin 16. A
- 26 fibrin layer 18 forms at the wound site 12 from fibringen
- 27 by the action of thrombin and the clotting of blood (Figs.
- 28 2 and 6). Surgical wounds, including those associated with

skin grafts, normally drain fluid. The fluid drainage from a surgical wound is generally heaviest during a postoperative period of about forty-eight hours. Wound Dressing 10 II. 5 . 6 The wound dressing IO generally comprises a cover 7 membrane 22 with an interior portion 24 surrounded by a 8 perimeter 26. The membrane 22 includes a skin contact 9 surface 28 with an adhesive coating 30. The membrane 22 10 preferably comprises a breathable semi-permeable material 11 characterized by an ability to pass moisture vapors and an 12 imperviousness to liquids. The adhesive coating 30 should 13 likewise be semi-permeable. Such membrane materials are 14 commercially available, an example being material referred 15 to as "Tagoderm", which is available from the 3M (Minnesota Mining and Manufacturing) Company of St. Paul, Minnesota. 17 Other semi-permeable materials are available and can be 18 successfully employed with the present invention. A 19 protective backing 23 is placed over the adhesive coating 30 20 on the membrane skin contact surface 28 until the membrane 22 is ready for application. 22 The membrane 22 comprises a pair of panels 19 with

23

inner, upturned edges 20 which can be adhesively joined 24

together to form a seam 21 which extends transversely across

the membrane 22 and projects generally upwardly therefrom. 26

The panels 19 can be secured together at the seam 21 by the 27.

adhesive coating 30 to form the seam 21. 28

- 1 A tube or sheath 34 includes a proximate end 36 located
- 2 under the membrane 22 and a distal or free end 38. The tube
- 3 34 can be inserted through the seam 21 which forms an
- 4 opening 32 between the panel edge strips 20 at approximately
- 5 the center of the membrane 22. A relatively short length of
- 6 the tube 34 adjacent to its proximate end 36 is shown under
- 7 the membrane 22, but greater lengths of the tube 34 could be
- 8 placed under the membrane 22. As shown in Fig. 5, the tube
- 9 proximate end 36 is open, and adjacent to the proximate end
- 10 36 an opening is formed. Preferably the tube opening 39
- 11 projects downwardly, i.e. away from the membrane skin
- 12 contact surface 28. The short length of the tube 34 which
- 13 is located under the membrane 22 can be releaseably secured
- 14 to the skin contact surface 28 by the adhesive coating 30,
- 15 preferably with the tube opening 39 facing downwardly.
- The tube 34 can comprise, for example, a flexible,
- 17 plastic tube of the type that is commonly used as a
- 18 protective sheath for protection of sterility for
- 19 percutaneous intravenous catheter placement. Such sheaths
- 20 are commercially available from Aero International, Inc. of
- 21 Reading, Pennsylvania.
- 22 At its distal end 38, the tube 34 is adapted for: 1)
- 23 closure with a variety of suitable closure devices; 2)
- 24 connection to various active and passive fluid collection
- 25 devices for draining and evacuating fluid from the wound
- 26 site; and 3) connection to various fluid source devices for
- 27 actively and passively introducing fluid to the wound site.
- Fig. 5 shows a bifurcated clip 40 for releaseably
- 29 closing and sealing the tube distal end 38, which is folded
- 30 upon itself as shown.

	. 1 <i>L</i>
1	Fig. 6 shows a vacuum tube end 41 inserted in the tube
. 2	distal end 38 and secured therein by ties or ligatures 43.
3	The vacuum tube 41 fluidically communicates with a suction
4	or vacuum source 42 for actively draining fluid from the
5	wound site. The suction or vacuum source 42 may comprise
6	relatively simple, hand-actuated bulb or bellows, or it may
7.	comprise a more sophisticated motorized pump which can be
8	actuated at predetermined time intervals or in response to
9	wound site conditions such as an accumulation of fluid und
10	the membrane 22.
11	Fig. 7 shows an injection port 44 sealed to the tube
12	distal end 38 by a band 45. The injection port 44 include
13	a sleeve 47 which can extend into the tube 34 to protect i
14	from needle puncture. The injection port 44 can be of the
15	type which is designed for reuse and which automatically
16	reseals after being punctured by a syringe needle. It wil
17	be appreciated that a wide variety of devices can be
18	employed for connecting the tube distal end 38 to various
19	liquid medication sources.
20	
21	III. Treatment Method
22	
23	According to the treatment method of the present
24	invention, the protective backing 23 is removed from the
25	membrane contact surface 28 to expose the adhesive coating
26	30 and the membrane 22 is placed over a wound site 12 with
27	its contact surface 28 down. The membrane perimeter 26 is
28	pressed against the healthy skin 16 surrounding the wound
29	site 12 to preferably form a relatively liquid-tight
30	adhesive bond therebetween. Various adhesive preparations

- l are commercially available for supplementing the bonding
- 2 action of the adhesive coating 30 in bonding the membrane
- 3 contact surface 28 to the healthy skin 16. The membranes 22
- 4 may be provided in various sizes to accomodate wounds of
- 5 different sizes. A sufficiently large membrane 22 should
- 6 normally be selected to provide ample overlap of the
- 7 perimeter 26 over the healthy skin 16 to insure a good bond
- 8 therebetween.
- 9 The tube distal end opening 39 may be placed directly
- 10 over the approximate center of the wound site 12, or it may
- ll be placed eccentrically or at a depending location with
- 12 respect to the wound site 12. A dependent or lower position
- 13 for the opening 39 with respect to the wound site 12 may be
- 14 preferred to facilitate fluid drainage. The dressing 10 may
- 15 be applied promptly after a wound is inflicted, e.g.
- 16 immediately after the graft removal procedure and a skin
- 17 graft operation. To reduce the risk of infection, it may be
- 18 advisable to promptly cover the open wound site 12. The
- 19 wound dressing 10 may be kept in a sterile package until it
- 20 is needed. Such sterile packages and packaging techniques
- 21 are well known. For example, ethylene oxide may be used to
- 22 sterilize the dressing 10 prior to placement in a suitable
- 23 sterile package. The protective backing 23 is removed from
- 24 the membrane 22, thereby exposing its adhesive-coated
- 25 contact surface 28.
- With the membrane 22 thus secured, a chamber 46 is
- 27 formed between the wound site 12 and the membrane contact
- 28 surface 28, and is surround by the membrane perimeter 26.
- 29 The chamber 46 fluidically communicates with the membrane
- 30 opening 32. In an evacuation mode of operation, such as

- 1 might be desirable for forty-eight hours or so after removal
- 2 of a split-thickness skin graft at a donor site, fluid 20
- 3 which accumulates in the chamber 46 is communicated through
- 4 the opening 32 and thence through the tube 34 for collection
- 5 and disposal. In a passive evacuation mode of operation,
- 6 the fluid 20 is evacuated through capillary action, or by
- 7 gravity with the opening 32 at a dependent, lower location
 - 8 in relation to the wound site 12. Such a capillary, passive $^{\circ}$
- 9 drainage action may be sufficient for draining the wound
- 10 site 12 in many situations. Alternatively, an active
- 11 evacuation mode of operation involves attaching the tube 34
- 12 to the suction/vacuum source 42 whereby the fluid 20 is
- 13 positively drawn from the wound site 12 and the chamber 46.
- 14 Such an active evacuation mode of operation may be preferred
- 15 when the dressing 10 is used in connection with a
- 16 hydrophilic colloidal material (hydrocolloid), as will be
- 17 explained in more detail hereinafter.
- 18 It may be desirable to operate the wound dressing 10 in
- 19 an introduction mode of operation whereby medications such
- 20 as antibiotics and growth factor solutions are introduced to
- 21 the wound site 12. In this mode of operation, the tube
- 22 distal end 38 is connected to a liquid solution source,
- 23 which may comprise a syringe or any of various liquid
- 24 containers for passive, gravity-induced introduction.
- 25 Various adaptors, valves and injection needle ports are
- 26 available for fluidically coupling the tube 34 to a wide
- 27 variety of liquid solution sources. For example, many such
- 28 connectors and adaptors are available from Aero

- 1 International, Inc. of Reading, Pennsylvania. Such
- 2 connecting devices are commonly used in connection with the
- 3 intravenous introduction of various liquid solutions.
- 4 In an active introduction mode of operation, solutions
- 5 may be pumped through the tube 34.into the chamber 46 for
- 6 application to the wound site 12.
- 7 The evacuation and introduction treatment steps can be
- 8 timed and sequenced as necessary to achieve the treatment
- 9 objectives. For example, treatment of a skin graft donor
- 10 site may involve fluid withdrawal and drainage for about two
- ll days immediately following the skin graft operation,
- 12 followed by treatment steps comprising the introduction of
- 13 antibiotics and/or growth factor solutions to the wound
- 14 site. The evacuation and introduction steps can be
- 15 alternated, and the intervals between such steps can be
- l6 progressively increased or decreased as necessary to
- 17 facilitate healing. As the wound heals, progressively
- 18 smaller amounts of fluid will ooze therefrom and the
- 19 frequency and duration of the drainage operations can be
- 20 correspondingly reduced and finally discontinued altogether.
- 21 It will be appreciated that the wound dressing and
- 22 treatment method of the present invention are broadly
- 23 concerned with introducing fluid to wound sites and
- 24 evacuating fluid therefrom. The fluid introduction and
- 25 evacuation procedures described herein can be performed
- 26 indefinitely without having to change the dressing 10. The
- 27 tube 34 cooperates with the membrane 22 to permit the same
- 28 dressing 10 to be used for both procedures, which may be

- l alternated as often as necessary. Infection risks and
- 2 patient discomfort can be reduced by minimizing wound
- 3 dressing changes.
- 4 The removal of toxins and bacteria from wounds is an
- 5 important aspect of the fluid drainage phase of the healing
- 6 process. The wound dressing of the present invention
- 7 facilitates removal of serum and other secretions to
- 8 minimize the risk of infecting the wound site and macerating
- 9 the tissue thereat. Growth factor solutions can be
- 10 important in promoting healing, and antibiotics can be
- ll important in preventing and treating infection. Hence, a
- 12 comprehensive wound treatment can be implemented with the
- 13 wound dressing and treatment method of the present
- 14 invention.
- The wound dressing 10 can be employed to irrigate a
- 16 wound whereby fluid is introduced and then removed.
- The operation of the wound dressing 10 is largely a
- 18 matter of fluid mechanics, and the function of the wound
- 19 dressing 10 would probably be determined by such factors and
- 20 variables as: 1) fluid viscosity; 2) permeability of the
- 21 membrane 22; 3) cross-sectional area of the tube 34 and the
- 22 area of its opening 39; 4) the integrity of the seal around
- 23 the membrane perimeter 26; 5) the drawing power of the
- 24 suction or vacuum source 42; 6) coagulation of the serum or
- 25 other fluid; 7) the area of the fluid collection chamber 46;
- 26 8) the length of the tube 34; and 9) gravity and the
- 27 relative positions of various components. Naturally,
- 28 varying one or more of these factors or variables could
- 29 change the operation of the system. It is anticipated that,
- 30 applying such well-known principles of fluid mechanics, all

- 1 of the wound dressing components could be properly sized and
- 2 designed. For example, the tube opening 39 could be
- 3 enlarged, or multiple openings could be provided to increase
- 4 the rate of fluid flow into the tube 34. The rate of fluid
- flow can further be increased by locating the tube distal
- 6 end 38 at a dependent area within the chamber 46, i.e. below
- 7 the level of most of the wound site 12. The tube 34 can
- 8 extend downwardly to a collection site below the level of
- 9 the wound site 12 to facilitate gravity drainage.
- 10 It is further anticipated that some fluids will resist
- 11 drainage because of their viscosities or because they tend
- 12 to coagulate. Drainage of such fluids can be effected by
- 13 irrigating the wound site 12.

14

IV. First Modified Embodiment 110

16

- 17 Figure 8 shows a wound dressing 110 comprising a
- 18 first modified embodiment of the present invention wherein a
- 19 relatively small membrane 122 is provided and functions as a
- 20 patch for a larger wound cover 115 with an opening 117 for
- 21 receiving a distal end 138 of a tube 134. The primary wound
- 22 cover 115 is selected to cover a wound site 112, and is
- 23 placed thereover in the normal fashion. The wound dressing
- 24 110 can be placed on the primary wound cover 115 in a
- 25 location chosen to enhance fluid introduction and/or
- 26 evacuation. For example, to enhance the evacuation of fluid
- 27 by gravity, it may be desirable to form the opening 117 at a
- 28 relatively low position of the wound site 112. Thus, fluid
- 29 will tend to flow to the tube 134 by gravity. To facility
- 30 the introduction and distribution of fluid, it may be

desirable to locate the wound dressing 110 at a relatively high position on the wound cover 115. In fact, two or more wound dressings 110 could be placed on a single, primary wound cover 115, with a lower wound dressing 110 being provided for fluid evacuation and an upper wound dressing 110 being provided for fluid introduction. In the practice of the treatment method of the present invention, the wound dressing 110 provides for considerable flexibility in locating the wound dressing 110 in an appropriate location on the wound site 112. After the 11 primary wound cover 115 is positioned, the opening 117 is formed at the chosen location and the wound dressing 110 may 12 be applied, much like a patch, with the tube distal end 138 13 extending through the primary wound cover opening 117. It 15 will be appreciated that wound dressings 110 may be changed as needed without changing the primary wound cover 115. 17 Second Modified Embodiment 210 18 19 A wound dressing 210 comprising a second modified 20 embodiment of the present invention is shown in Figs. 9 and 21 10 and includes an intermediate layer of material 250 22 between a wound site 212 and a cover membrane 222. intermediate material layer 250 can comprise a variety of materials with varying properties such as: 1) absorbency; 2) wicking or capillary action; and 3) surface contact action. 27 The intermediate material layer is primarily located in a

28 chamber 146 formed between the wound 212 and the membrane

29 222.

- As a first example of an intermediate material layer
- 2 250, several hydrophilic colloid materials (i.e.
- 3 hydrocolloids) are available which would tend to absorb
- 4 fluids. For example, Envisan wound cleaning pads and paste
- 5 are available from Marion Laboratories, Inc. of Kansas City,
- 6 Missouri and comprise: spherical, hydrophilic Beads of
- 7 Dextranomer, 0.1 to 0.3mm in diameter; polyethylene glycol
- 8 3000 in the pad; polyethylene glycol 600; and water QS
- 9 enclosed in a polyamide net bag in the pad or available in a
- 10 metal foil packet for the paste. The Envisan dextraminer
- 11 beads function to absorb fluid and facilitate healing by
- 12 drawing fluid from the wound. Excess fluid can be drained
- 13 from the intermediate material layer 250 to prolong its
- 14 effectiveness. Other hydrocolloids are commercially
- 15 available and may be employed with the wound dressing 210 of
- 16 the present invention, e.g. dextranimers available under the
- 17 trademark "Debrisan".
- 18 Alternatively, the intermediate material layer 250 can
- 19 comprise a mesh or sheet of synthetic material which is
- 20 generally nonabsorbent and would tend to wick fluid from the
- 21 wound site 212 to a tube distal end 238. For example, rayon
- 22 available under the trademark Owens non-adherent surgical
- 23 dressing from the Davis & Geck division of American Cyanamid
- 24 Company of Danbury, Connecticut could be used to form such
- 25 an intermediate material layer 250, and material available
- 26 from Marion Merrell Dow, Inc. of Kansas City, Missouri under
- 27 the trademark "Envinet" could also be employed. Such
- 28 materials may be referred to as "surface active", i.e.
- 29 promoting fibrin sealing on the wound surface. Such
- 30 materials can also satisfy a capillary purpose whereby fluid

- 1 is wicked from the wound for collection in the chamber 246
- 2 and ultimately for drainage. With many such materials, a
- 3 balance is struck between surface action and capillary
- 4 action, i.e. one such function is often maximized at the
- 5 expense of the other. For example, Owens rayon is generally
- 6 considered to be relatively surface active, but may provide
- 7 less capillary action than other materials. Envinet mesh,
- 8 on the other hand, provides greater capillary action, but
- 9 may provide less surface action as compared to the rayon
- 10 material.
- 11 Other materials that can be used for the intermediate
- 12 material layer 250 include polyurethane foam and
- 13 polyurethane mesh.
- 14 The wound dressing 210 can be used according to methods
- 15 for use with the other wound dressings 10 and 110, and
- 16 includes the additional step of placing the intermediate
- 17 material layer 250 over the wound site 212. It will be
- 18 appreciated that there may be a number of materials suitable
- 19 for the intermediate layer 250 to achieve various
- 20 objectives.
- 21 A closure patch 251 is provided for placement over the
- 22 tube distal end 238 and is adapted for securing it in a
- 23 folded configuration to the membrane 222. The closure patch
- 24 251 can be used in conjunction with a bifurcated clip 240 as
- 25 shown in Figs. 9 and 10, and permits convenient access to
- 26 the tube distal end 238 for coupling it to various devices
- 27 such as those described herein, allowing future reuse of the
- 28 tube or intermittent function. Alternatively, the tube can

be severed at the surface of the membrane, allowing the closure patch 251 or a similar patch of the same material as the wound dressing 10 to permanently seal the tube site. VI. Third Modified Embodiment 310 A fluidic connection system 310 comprising a third modified embodiment of the present invention is shown in Figs. 11-16. Without limitation on the generality of useful 10 applications of the fluidic connection system 310, it is shown in connection with a urine collection system 312 and 11 functions as a condom catheter. The connection system 310 12 generally includes a membrane assembly 314 and a tube 13 14 assembly 316. The membrane assembly 314 includes a membrane 318 with 15 an inner or skin contact surface 320, an outer surface 322, 17 a perimeter 324 and an interior portion 326. As shown in 18 Fig. 11, the membrane 318 comprises first and second panels 19 328, 330. 20 The panels 328, 330 include inner contact surfaces 329, outer surfaces 331, perimeters 333, and edges 335 with edge strips 332 which are joined together in opposing relation to 23 form a seam 334 extending transversely across the membrane 24 318 between opposite sides of its perimeter 324. A tube 25 opening 336 extends through the seam 334 approximately in the middle thereof and is open at the membrane inner and outer surfaces 320, 322. 28 An adhesive layer 338 substantially covers the membrane

29 inner surface 320 and releasably secures a two-piece
30 protective backing 340 (e.g. paper, plastic or some other

- 1 suitable material). The backing 340 can form a transverse
- 2 seam 342 with a pair of unattached edge strips 344 adapted
- 3 to be grasped for pulling off the backing 340. The membrane
- 4 318 of the fluidic connection system 310 can comprise a
- 5 semi-permeable material.
- 6 The tube assembly 316 includes an outer tube or sheath
- 7 346 with proximate and distal ends 348, 350 and a passage
- 8 347 extending therebetween. The proximate end 348 extends
- 9 through the tube opening 336 and has a bifurcated
- 10 configuration with a pair of longitudinally-extending,
- 11 opposed slits 352 forming an opposed pair of tabs 354 each
- 12 placed against a respective panel contact surface 320 (Fig.
- 13 11). The tabs 354 can be secured to the respective panel
- 14 inner surfaces 320 by the adhesive 338 thereon. However,
- 15 for many applications of the connecting system 310 it may be
- 16 preferrable for the tabs 354 not to have adhesive on them.
- 17 The tabs 354 form a mouth 356 open at the outer tube
- 18 proximate end 348 and located adjacent to the membrane inner
- 19 surface 320. The outer tube or sheath 346 can comprise a
- 20 flexible, collapsible, impervious material.
- The tube assembly 316 also includes an inner tube or
- 22 conduit 358 with a proximate end 360 including a funnel 362,
- 23 a distal end 364, and a conduit bore 366 extending between
- 24 and open at the conduit ends 360 and 364.
- 25 An annular connector/seal band 372 receives the conduit
- 26 358 and includes enlarged-diameter end flanges 374 with a
- 27 reduced-diameter, annular channel or waist 376 therebetween.
- 28 The connector or seal band 372 can be intergally formed with
- 29 the conduit and thus permanently fixed in position thereon,
- 30 or, alternatively, the band 372 can slideably receive the

23

conduit for adjustable repositioning. Preferrably the band 372, in either configuration, forms a relatively fluid-tight seal on the conduit 358. The band 372, like the funnel 362, can be slid through the sheath passage 347 for placement proximal to the sheath distal end 350 (Fig. 15). Belt or tie means 378 can be provided for sealingly fastening the sheath 346 to the band 372. As shown in Fig. 15, the belt/tie means 378 can comprise ligatures 380, which can be wrapped around the sheath 346 for tightening it against the 10 band channel 376. Belt/tie means 378 can comprise other 11 suitable fasteners, such as strips with hook-and-loop fasteners (i.e. fasteners available under the trademark 12 13 "Velcro"), rubber or elastic bands, plastic coated wire twist ties, etc. Multiple bands 372 can be used for 14 connecting and sealing the sheath 346 and the conduit 358. 15 The conduit distal end can project distally from the 16 sheath distal end 350 (Fig. 15) for connection to tubing 382 17 by a suitable tubing connector, such as the multi-diameter, 18 double male-ended ("Christmas Tree") connector 384 shown in 19 20 Figs. 11 and 15. The tubing 382 can lead to a suitable fluid collection vessel 386, which can be positioned remote from the patient. 22 23 24 Applications and Operation VII. 25

The fluidic connector 310 can be utilized for a variety 26 of fluidic connection applications without the inner tube or conduit assembly 358. For example, the fluidic connection 28 29 system 310 can function as a wound dressing which operates in a manner similar to the wound dressings 10, 110 and 210

- l described above. In such applications the membrane 318 can
- 2 comprise a semi-permeable, plastic, film adherrent dressing
- 3 sheet, such as those commercially available under the trade
- 4 names "Op-Site", "Tagaderm", and "Bio-Occlusive". The outer
- 5 tube or sheath 346 can be utilized as a two-way conduit for
- 6 draining wound exudate and for introducing liquids to the
- 7 wound. The liquids introduced could comprise, for example,
- 8 aqueous solutions for irrigating the wound and growth
- 9 factors for promoting healing. Epidermal growth factor
- 10 ("EGF") is available from Vicron. Platelet derived growth
- 11 factor is available from the Curatech Corporation. Such
- 12 growth factors can accelerate healing and re-
- 13 epithelialization of wound sites. Without limitation on a
- 14 wide variety of wounds that can be treated with such
- 15 dressings, they are particularly suitable for partial
- 16 thickness wounds, such as skin graft donor sites. Drainage
- 17 and liquid application can be alternated without having to
- 18 intermittently change the membrane 318. Frequent dressing
- 19 changes can be painful to skin wound patients and burdensome
- 20 to health care personnel.
- 21 As with the previously described application of the
- 22 wound dressing 110 shown in Fig. 8, the connection system
- 23 310 can be applied at any desired location on a larger patch
- 24 or membrane, and can be used in various multiple
- 25 combinations, if desired. For example, one connection
- 26 system 310 can be used for introducing fluids, and another
- 27 connection system 310 can be used for draining fluids, with
- 28 both connection systems 310 operating simultaneously if
- 29 desired.

- 1 To promote efficient drainage, the connection system
- 2 310 can be located at a dependent part of a larger dressing.
- 3 Alternatively, mechanical suction equipment can be connected
- 4 for promoting drainage.
- 5 Another application of the fluidic connection system
- 6 310 is placement over percutaneous catheters, drain tubes,
- 7 etc. Such tubes present infection risks where they
- 8 penetrate the skin surface, and can require frequent
- 9 application of antibiotics to reduce the risk of infection.
- 10 Percutaneous tubes are often sutured in place at the stab
- 11 wound locations where they penetrate the skin, and the
- 12 sutures are further susceptible to infection and can cause
- 13 swelling and patient irritation. The connection system 310
- 14 can be placed over such a percutaneous drain tube or
- 15 catheter site, with the tubing extending through the sheath
- 16 346 in the manner of the conduit 358. The tubing can be
- 17 secured, for example with one or more bands 372, to protect
- 18 against traction forces which might otherwise tend to pull
- 19 the tubing loose. By utilizing a semi-permeable, breathable
- 20 material for the membrane 318, the skin surrounding a
- 21 percutanious tubing entry site can be protected against
- 22 maceation.
- 23 For use as a condom catheter in a urine collection
- 24 system 312, the backing 340 can be removed from the first
- 25 panel 328, which is then adhesively secured to the ventral
- 26 side 389 and the lateral sides 391 of a flaccid penis 388
- 27 with the urethra orifice or meatus 390 directed at the
- 28 sheath mouth 356 and the sheath tabs 354 placed on the top
- 29 and bottom of the glans or penile head 392 (Fig. 13). The

- 1 second panel 330, with the backing 340 removed, can then be
- 2 adhered to the penile dorsal side 394 and to the first
- 3 panel 328.
- 4 The procedure described above provides a relatively
- 5 secure attachment of the connection system 310 to the penis
- 6 388, since the penile shaft 396 and the penile head 392
- 7 provide substantial areas of attachment. The attachment can
- 8 further be enhanced by prestretching the flaccid penis to
- 9 provide maximum contact area.
- The connection system 310 described above can be
- 11 utilized as a complete condom catheter by fluidically
- 12 connecting the sheath distal end 350 to a suitable urine
- 13 vessel, for example with a band such as that shown at 45 in
- 14 Fig. 7. Alternatively, the inner tube or conduit 358 can
- 15 then be inserted through the sheath passage 347 in its open,
- 16 distal end 350. The funnel 362 can be placed against the
- 17 glans 392 over the meatus 390, and can be secured in this
- 18 position by fastening the sheath 346 to the band 372 with
- 19 the sheath 346 slightly in tension and the conduit 358
- 20 slightly in compression. The funnel 362 can comprise a
- 21 moldable plastic material, and its end can be rolled or
- 22 flanged as shown in Fig. 14 for patient comfort. However,
- 23 in operation the funnel 362 is not required to form a fluid-
- 24 tight seal with the glans 392, and it is anticipated that
- 25 the funnel 362 may slip distally away from the glans 392.
- 26 The funnel 362 cooperates with the connection system 310 to
- 27 direct a surge of urine into the conduit 358. Urine which
- 28 escapes the funnel 362 can collect in an interstitial space
- 29 397 between the sheath 346, the conduit 358, the glans 392
- 30 and the band 372. Urine in the interstitial space 397 can

PCT/US90/01777 WO 90/11795

- drain to the funnel 362 for evacuation through the conduit
- 358. Placement and sizing of the sheath 346, the conduit
- 358 and the band 372 can be adjusted to vary the volume of
- the interstitial space 397.
- The procedure for applying the connection system 310
- can be varied according to the conditions of particular
- patients and the preferences of persons applying it.
- Properly adherred to a patient, the collection system 310
- should be functional for a relatively long period of time,
- and a semi-permeable membrane material can be utilized to
- enhance patient comfort. 11
- Other useful applications of the connection system 310 12
- include placement over circumferentially injured limbs and 13
- phalanges for draining exudates and/or introducing liquids.
- For example, an injured hand could be treated by securing.
- the connection system 310 at the wrist, a forearm could be 16
- treated by adhering the fluidic connection system 310 at 17
- 18 the elbow, etc.
- 19 Yet another application is for accessory connections
- 20 whereby various fluid devices and connectors could be
- 21 combined in systems attached to patients for appropriate
- treatment and diagnostic procedures. Such additional 22
- accessories include Jackson-Pratt and Blake suction tubing 23
- 24 devices, Y-connectors, sampling ports, "Injectaport"
- devices, fluid pumps and various fluid reservoirs. Hand-25
- actuated bulbs could be placed in the tubing, and valving
- could be placed where it is needed.
- A further application of the fluidic connection system
- 310 would involve placing the membrane 318 over an
- intermediate material layer 250 as described in connection

with the wound dressing 210 comprising a second modified embodiment of the present invention (Figs. 9 and 10). An inner tube or conduit such as that shown at 358 could then be extended through the sheath 346, secured thereto by a band or bands 372, and the inner tube or conduit distal end 5 364 could be placed beneath the intermediate material layer 6 250 adjacent to the tissue surface at the wound site 212, or 7 the conduit distal end 364 could be embedded within the intermediate material layer 250. The inner tube or conduit 358 could then be used for draining exudate from or 10 introducing fluids to the wound 212. . It is to be understood that while certain forms of the 12 present invention have been illustrated and described 13 herein, it is not to be limited to the specific forms or arrangement of parts described and shown. 15 16 17 18 19 20 21 22 23 24 25 26

29

29 C L A I M S

What is claimed and desired to be secured by Letters Patent is as follows:

- 1. A fluidic connection system, which comprises:
 - (a) covering means with a contact surface and an outer surface;
 - (b) adhesion means for releasably attaching said covering means on said contact surface thereof;
 - (c) said covering means having an interior portion with an opening extending between and open at the contact and outer surfaces thereof; and
 - (d) tube means having a proximate end extending through said opening and terminating adjacent said contact surface and a distal end located outwardly from said outer surface, said tube means fluidically communicating with said contact surface.
- The invention of Claim 1 wherein said covering means comprises a semi-permeable material.

- 3. The invention of Claim 1 wherein said covering means includes:
 - (a) first and second panels each having a perimeter and an edge;
 - (b) each said panel having an inner contact surface and an outer surface;
 - (c) a seam extending transversely across said connection system and extending outwardly from said outer surfaces of said panels, said seam comprising said panels being connected together at their respective contact surfaces adjacent to their respective edges and said seam having opposite ends; and
 - (d) said tube opening extending through said seam between said panel contact surfaces and intermediate said seam ends, said tube opening extending between and open at said adjacent panel edges and at said contact surfaces.
- 4. The invention of Claim 1 wherein said adhesion means comprises an adhesive coating on said panel contact surfaces.
- The invention of Claim 1 wherein said tube means comprises a flexible, collapsible material.

- 6. The invention of Claim 2 wherein:
 - (a) each said panel includes a perimeter and an edge strip, each said edge strip being demarcated by a fold line and folded outwardly from a remainder of a respective panel; and
 - (b) said tube opening extends between said edge strips.
- 7. The invention of Claim 1 wherein said tube means proximate end includes:
 - (a) an opposed pair of longitudinally-extending slits; and
 - (b) a pair of opposed end tabs each formed between said slits, said tube means proximate end being open between said tabs.
- 8. The invention of Claim 7 wherein:
 - (a) each said tab is adhesively connected to a respective panel skin contact surface adjacent to said seam.

- 9. The invention of Claim l wherein said tube means includes:
 - (a) an outer, tubular sheath connected to said panels at said seam and having a proximate end, a distal end, and a sheath passage extending between said sheath proximate and distal ends; and
 - (b) an inner, tubular conduit extending through said sheath passage and including conduit proximate and distal ends and a conduit bore extending between said conduit ends.
- 10. The invention of Claim 9 wherein:
 - (a) said conduit includes funnel means at its proximate end, said funnel means being adapted to slide longitudinally through said sheath passage.
 - 1. The invention of Claim 9 wherein said tube means includes:
 - (a) tube clamp means clamping said sheath to said inner conduit.

- 12. The invention of Claim 11 wherein said tube clamp means comprises:
 - (a) an annular band with enlarged proximate and distal ends, a bore extending between said ends and a reduced-diameter waist between said ends, said bore receiving said conduit; and
 - (b) belt means circling said sheath and securing said sheath to said band waist.
- 13. The invention of Claim 12 wherein:
 - (a) said belt means comprises a tensile member wrapped around said sheath and said band waist.
- 14. The invention of Claim 12 wherein:
 - (a) said belt means comprises a strap with hookand-loop fasteners.
- 15. A fluidic connection system which comprises:
 - (a) covering means including:
 - (1) an inner contact surface;
 - (2) an outer surface;
 - (3) a first panel including a perimeter and an edge;
 - (4) a second panel including a perimeter and an edge;
 - (5) each said panel having an inner contact surface and an outer surface;

- (6) a seam extending transversely across
 said connection system and comprising
 said panels being connected together at
 their respective edges, said seam having
 opposite ends; and
 - (7) a tube opening extending through said seam between said panel contact surfaces and intermediate said seam ends, said tube opening extending between and open at said adjacent panel edges and at said contact surfaces;
- (b) an adhesive coating on said panel contact surfaces; and
- (c) tube means including:
 - tube opening and terminating adjacent said skin contact surface, said proximate end having an opposed pair of longitudinally-extending slits and a pair of opposed end tabs each formed between said slits, said tube means proximate end being open between said tabs.

- 16. The invention of Claim 15 wherein said tube means includes:
 - (a) an outer, tubular sheath connected to said panels at said seam and having a proximate end, a distal end, and a passage extending between said sheath proximate and distal ends; and
 - (b) an inner, tubular conduit extending through said sheath passage and including conduit proximate and distal ends and a conduit bore extending between said conduit ends.
- 17. The invention of Claim 16 wherein:
 - (a) said conduit includes funnel means at its proximate end, said funnel means being adapted to slide longitudinally through said sheath passage.
- 18. The invention of Claim 16 wherein said tube means includes:
 - (a) tube clamp means clamping said sheath to said inner conduit.

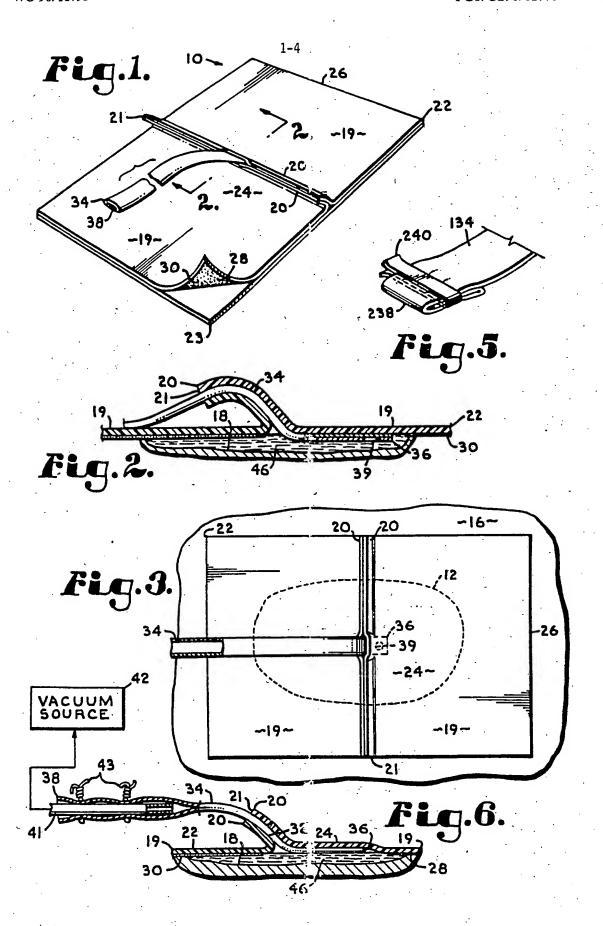

- 19. A condom catheter for attachment to a penis, which includes:
 - (a) a membrane including:
 - (1) an inner, skin contact surface;
 - (2) an outer surface;
 - (3) a first panel including an edge strip and a perimeter;
 - (4) a second panel including an edge strip and a perimeter;
 - (5) a seam extending transversely across
 said membrane and comprising said panel
 edge strips attached together; and
 - (6) a tube opening extending through said seam between said membrane inner and outer surfaces;
 - (b) adhesive on said panel inner contact surfaces; and
 - (c) tube means including a proximate end extending through said tube opening and a distal end, said tube means including a passage extending between and open at said ends.

- 20. The invention of Claim 19 wherein said tube means includes:
 - (a) opposed pair of longitudinally-extending slits at said proximate end;
 - (b) an opposed pair of tabs formed between said slits, each said tab being adhered to a respective panel inner contact surface; and
 - (c) a mouth open between said tabs at said tube means proximate end.
- 21. The invention of Claim 20 wherein said tube means includes:
 - (a) an outer sheath comprising a flexible, collapsible material and having proximate and distal ends with a passage extending therebetween;
 - (b) an inner, tubular conduit extending through said sheath passage and including conduit proximate and distal ends and a conduit bore extending between said conduit ends;
 - (c) an annular band with enlarged proximate and distal ends and a bore extending between said end, said bore receiving said conduit and a reduced-diameter waist between said ends; and
 - (d) belt means circling said sheath adjacent to its distal end and securing said sheath to said band waist.

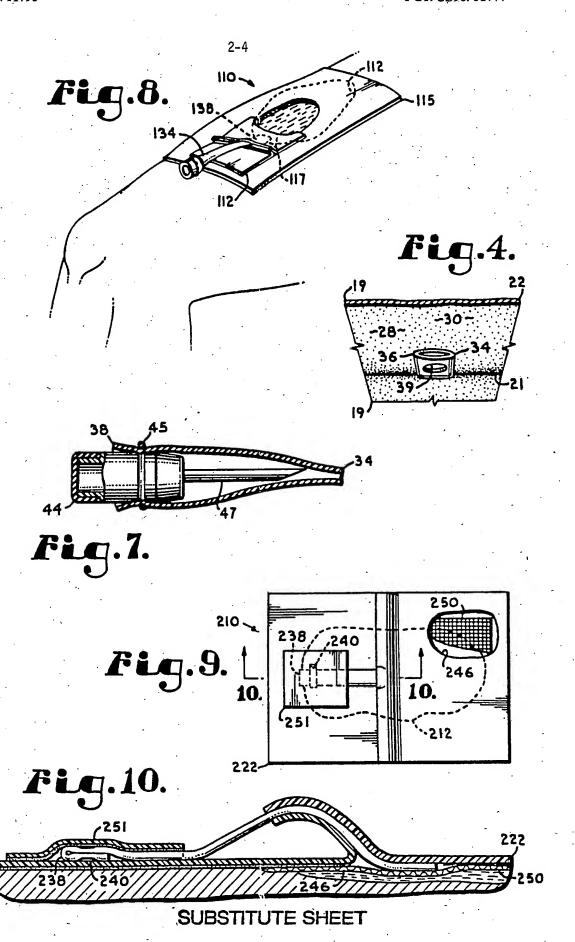

- 22. A method of dressing a wound surrounded by unwounded skin, which comprises the steps of:
 - (a) applying a semi-permeable covering comprising first and second panels each including a skin contact surface, an outer surface, and a perimeter with an edge over the wound;
 - (b) releaseably and adhesively attaching said skin contact surfaces of said panels to said unwounded skin around said wound;
 - (c) forming a seam with opposite ends and extending transversely across said covering by adhesively engaging said panel contact surfaces along respective strips adjacent to said edges thereof;
 - (d) providing an opening open at said perimeter edges and at said contact surface betweensaid interconnected strips and intermediate said seam opposite ends;
 - (e) extending a tube with open proximate and distal ends through said tube opening;
 - (f) positioning said tube proximate end adjacent to said seam and said skin contact surface; and
 - g) alternately introducing a liquid to and draining said wound through said tube.
- 23. The method of Claim 22 wherein said step of introducing a liquid to said wound includes introducing liquid medication to said wound.

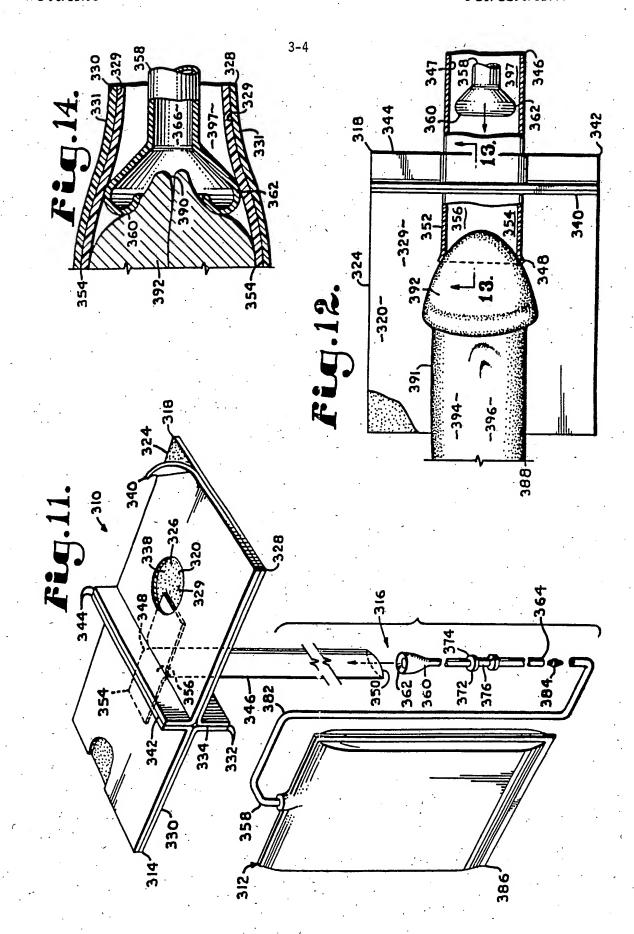

- 24. The method of Claim 22 wherein said step of introducing a liquid to said wound includes irrigating said wound.
- 25. A method of catheterizing a penis, which comprises the steps of:
 - (a) adhering a membrane comprising first and second panels each including a skin contact surface, an outer surface and a perimeter with an edge to the penis;
 - (b) forming a seam with opposite ends and extending transversely across said membrane by adhesively engaging said panel contact surfaces along respective strips adjacent to said edges thereof;
 - (c) providing an opening open at said panel edges and at said contact surface between said interconnected strips and intermediate said seam opposite ends;
 - (d) extending a sheath with a proximate end having an opposed pair of longitudinallyextending slits forming an opposed pair of tabs through said tube opening;
 - (e) positioning a mouth open to a passage of said sheath and formed between said tabs at said seam adjacent to said skin contact surfaces; and

- (f) placing said tube mouth distal to and approximately in alignment with the meatus of said penis.
- 26. The invention of Claim 25, which includes the further steps of:
 - (a) extending a conduit with proximate and distal ends and a bore extending therebetween through said sheath passage;
 - (b) placing said conduit proximate end in proximity to and in alignment with said meatus; and
 - (c) fluidically sealing said sheath to said conduit.
- 27. The invention of Claim 25, which includes the further steps of:
 - (a) adhering said first panel to the ventral side of said penis;
 - (b) adhering said second panel to the dorsal side of said penis; and
 - (c) adhering said first and second panels to each other.
- 28. The invention of Claim 26, which includes the additional steps of:
 - (a) providing a funnel on said conduit proximate end; and
 - (b) placing said funnel against the head of said penis in covering relation over said meatus.

V. OBSERVATIONS WHERE CERTAIN CLAIMS WERE FOUND UNSEARCHABLE	
V. OBSERVATIONS INTEREST OF CONTROL CIAIMS under Article 17(2) (a) for	the following reasons:
This international search report has not been established in respect of certain claims under Article 17(2) (a) for	ority, namely:
1. Claim numbers because they relate to subject matter I not required to be searched by this Auth	,
2. Claim numbers, because they relate to parts of the international application that do not comply w	ith the prescribed require-
 Claim numbers, because they relate to parts of the international sparch can be carried out 1, specifically: ments to such an extent that no meaningful international sparch can be carried out 1, specifically: 	
	•
Claim numbers, because they are dependent claims not drafted in accordance with the second are PCT Rule 6.4(a).	nd third sentences of
VI.[x] OBSERVATIONS WHERE UNITY OF INVENTION IS LACKING ²	·
This International Searching Authority found multiple inventions in this international application as follows:	,
I. claims 1-24 drawn to a wound drainage system;	V
class 604 subclass 305	
II. claims 25-28 drawn to a method of catheterizing a penis; class 604 subclass 349	
1. As all required additional search fees were timely paid by the applicant, this international search report co	
2. As only some of the required additional search fees were timely paid by the applicant, this international those claims of the international application for which fees were paid, specifically claims:	search report covers only
3. No required additional search fees were timely paid by the applicant. Consequently, this international seather invention first mentioned in the claims; it is covered by claim numbers:	arch report is restricted to
	correbing Authority did not
4. X As all searchable claims could be searched without effort justifying an additional fee, the international sinvite payment of any additional fee.	seatening Authority did not
Remark on Protest	• .
The additional search fees were accompanied by applicant's protest.	
No protest accompanied the payment of additional search fees.	· · ·
